Using the YangBaxter package [1], we provide the classifications of braces (up to order 32) and skew-braces (up to order 16) according to the additive or multiplicative groups which are Miller–Moreno p -groups. Moreover, we give some information concerning nearing braces from the LocalNR package.

Note that braces of size 64 are not implemented in the AllBraces library. From the LocalNR package [2] and [3] we can extract local nearrings of order 128 via where the arguments k, l, m, n are from IdGroup of the additive group and the multiplicative group, respectively, w is the position in the list. As an example, we give the nearring $R := \text{LocalNearRing}(128, 160, 64, 183, 2)$ with $|R : L| = 2$. Obviously that $R^* = 1 + L$, and so we can extract the nearring ideal $I = (L, +, \cdot)$, the multiplicative and additive groups of a nearing brace [4] $B = (L, 1 + L)$ of order 64.

БРЕЙСИ ТА КОСІ БРЕЙСИ І GAP: ПАКЕТИ YANGBAXTER ТА LOCALNR

Використовуючи пакет YangBaxter, ми подали класифікацію брейсів (до 32 порядку) і косих брейсів (до 16 порядку) відповідно до адитивних або мультиплікативних груп, які є p -групами Міллера–Морено. Крім того, ми надаємо деяку інформацію щодо майже-кільцевих брейсів з пакетом LocalNR.
